Experiment 4

1. Find a factorial of a number

```
In [1]: num = int(input("Enter a number"))
        fact = 1
        for i in range(1, num + 1):
            fact *= i
        print(fact)
```

6

2. Find whether the given number is Armstrong number

```
In [5]: num = int(input("Enter a number: "))
        order = len(str(num))
        sum = 0
        temp = num
        while temp > 0:
            digit = temp % 10
            sum += digit ** order
            temp //= 10
        if num == sum:
            print("Armstrong number")
        else:
            print("Not Armstrong number")
```

Armstrong number

3. Print Fibonacci series up to given term

```
In [6]: n = int(input("enter the number of terms"))
        a = 0
        b = 1
        for i in range(n):
            print(a, " ")
            a, b = b, a + b
```

```
a, b = b, a+b
```

4. Write a program to find if the given number is prime number or not

```
In [7]: num = int(input("Enter a number: "))
if num <= 1:
    print("Not a prime number")
else:
    for i in range(2, num):
        if num % i == 0:
```

```
    print("Not a prime number")
    break
else:
    print("Prime number")
```

Prime number

5. Check whether given number is palindorme or not

```
In [9]: n = int(input("Enter a number: "))
reverse = 0
temp = n
while temp != 0:
    reverse = (reverse * 10) + (temp % 10)
    temp = temp // 10
if n == reverse:
    print("Paindrome")
else:
    print("Not Palindrome")
```

Paindrome

6. Write a program to print the sum of digits

```
In [10]: n = int(input("Enter a number: "))
sum = 0
s = str(n)
temp = n
for i in s:
    digit = temp % 10
    temp = temp // 10
    sum += digit
print(sum)
```

10

7. Count an print all numbers divisible by 5 and 7 between 1 and 100

```
In [11]: for i in range(1, 101):
```

```
for i in range(1, 101):  
    if i % 5 == 0 and i % 7 == 0:  
        print(i)
```

35

70

8. Convert all lowercase letters to uppercase letters in a string.

In [13]:

```
s = input("Enter a string: ")  
result = s.upper()  
print("Uppercase string:", result)
```

Uppercase string:

9. Print all prime number between 1 to 100

In [18]:

```
for num in range(1, 101):  
    if num > 1:  
        for i in range(2, num):  
            if num % i == 0:  
                break  
        else:  
            print(num)
```

10. Print the table for a given number.

In [19]:

```
n = int(input("Enter any number"))  
for i in range(1,11):  
    print(n,"*",i,"=",n*i)
```

```
60 * 1 = 60  
60 * 2 = 120  
60 * 3 = 180  
60 * 4 = 240  
60 * 5 = 300  
60 * 6 = 360  
60 * 7 = 420  
60 * 8 = 480  
60 * 9 = 540  
60 * 10 = 600
```
